

ABSTRACT OF THE DISCLOSURE

A food processor for processing foodstuffs comprises a base housing, a motor, a drive shaft, a tool, a bowl, a lid and a tray. The tool is rotatably securable to the drive shaft and rotatable by the motor. The bowl is removably securable to the base housing and includes an inner surface area.

- 5 The lid has an inner surface area. The lid is removably securable to the bowl to create a processing chamber between the inner surface areas of the bowl and lid in an assembled position. The tray is removably securable within the processing chamber and is manually rotatable relative to the bowl and lid, independently of the drive shaft and tool, in the assembled position.
